Condition monitoring for more safety and efficiency

Connect! is an innovative monitoring and communications technology. It is a great help for users to get the maximum availability and efficiency out of their machines.

As the foundation of forward-looking fleet management, Connect! enables transparent administration, optimum job planning and remote monitoring of machines.

Constant condition monitoring makes it possible to do need-based maintenance. It reduces contingency costs to a minimum. Analysis of sensor data, some in real time, enables a reliable and fast-reacting information system.

How it works: Hardware, data transfer and software

The Connect! hardware module is integrated in the machine and connected to the central control unit.

The module reports events and diagnosis codes, as well as data on operating hours, fuel consumption, idle time etc., by mobile radio (GPS data query by satellite) to a central data server.

The web-based Connect! software application provides the data to users, subdealers, sales partners and the manufacturer for further use. Connect! can be used on PCs, laptops, tablets and smartphones (Windows, iOS, Android).

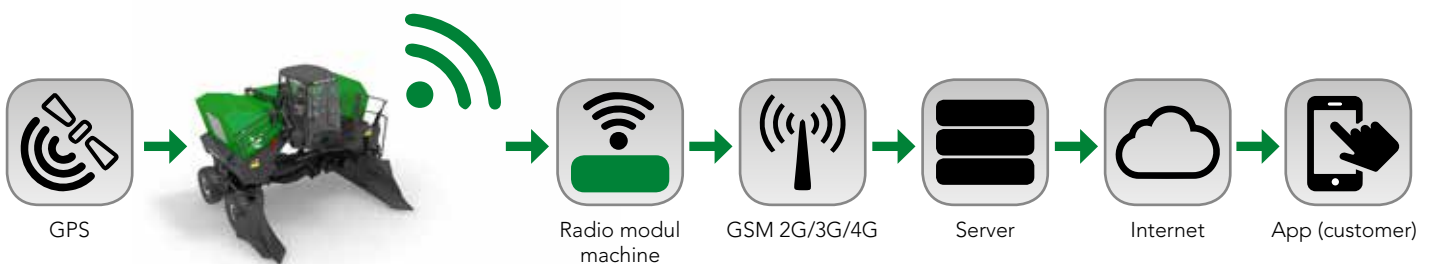

Benefits for the customer

- ✓ Exact documentation of use
- ✓ Improved economy through insights into operating conditions, consumption, idle times etc.
- ✓ Fast support from the manufacturer and service partner
- ✓ For rentals, a clear basis for setting rates
- ✓ Knowledge of exactly where the machine is
- ✓ Storage of historical data for evidence, evaluations, etc.

Benefits for the service partner

- ✓ Reduction in service call costs through easier and faster troubleshooting
- ✓ Reduction in service costs through direct access to the machine data
- ✓ Optimization for maintenance planning
- ✓ Support for spare parts management
- ✓ Proactive spare parts sales
